How it **Began**

How it Began

Web Page Design is a very important component to create a successful site, because it's the first impression that a user has from your homepage and your company, and it's a way to make the user confident that you have a professional Web presence. It is important for the website to be clear, concise and have well presented information. We do not charge for unique ideas and extras while we are in the designing process. We just do it, and usually for no charge.

We provide your site with:

Personality

Interface design, user experience, look and feel, web identity/branding, content presentation, navigation systems, architecture, hierarchies, web environments.

Intelligence

Site building, authoring, content collation, content organisation, HTML, DHTML, XML, ASP, ASP.net, PerlScript, JavaScript, VBScript, Flash MX, Java, Active X, Visual Basic, ColdFusion, Visual InterDev, PHP.

Memory SQL, MiniSQL, MySQL, mSQL, SQLBase, Oracle, FoxPro, Access and CSV format.

We know how this looks, but this is how we started, and we take pride in that!

Cloud Hosting Explained

Cloud hosting is a service that allows individuals and organizations to store and access their data, applications, and resources over the internet through remote servers. Instead of relying on a local server or a physical infrastructure, cloud hosting utilizes a network of servers hosted in data centers. Users can scale their computing resources up or down based on their needs, paying only for what they use. This approach provides flexibility, cost-effectiveness, and accessibility, enabling users to run applications and store data without the need for on-premises hardware maintenance.
